| Product Description  | Terroxy Thin-set Epoxy Terrazzo Flooring System is a set of resinous floor coatings. Under the reference PCR, Terroxy Thin-set Epoxy Terrazzo Flooring System falls under the following classification:  "Mortar, Monolithic Mortars, and Terrazzo: A composite material consisting of marble, silica sand, granite, glass or other suitable aggregate in a binder matrix of Portland cement mortar, epoxy resin, polyester resin, or vinyl ester resin. Typically installed to build thickness greater than 180 mils." |  |  |  |  |  |  |

#### Limitations:

In order to support comparative assertions, this EPD meets all comparability requirements stated in ISO 14025:2006. However, differences in certain assumptions, data quality, and variability between LCA data sets may still exist. As such, caution should be exercised when evaluating EPDs from different manufacturers or programs, as the EPD results may not be entirely comparable. Any EPD comparison must be carried out at the construction works level per ISO 21930:2017 guidelines. The results of this EPD reflect an average performance by the product and its actual impacts may vary on a case-to-case basis.

### **Company Profile**

Terrazzo & Marble Supply Companies began over 75 years ago with a simple notion, to provide our customers with the highest quality products and unmatched customer service. It manufactures and supplies a portfolio of products including terrazzo flooring, resinous flooring, natural stones, tiles, quartz, porcelain, and wall finishes. As a 100% employee owned company, our commitment to quality products and service will continue to be a focus as a growing, innovative and trustworthy company.

#### **Product Definition and Characteristics**

Terroxy Thin-set Epoxy Terrazzo Flooring System is a set of resinous floor coatings manufactured by T&M in its manufacturing plant in Alsip, IL. The coatings offer outstanding durability, chemical resistance, and bacteria/fungal growth resistance. Under the reference PCR, Terroxy Thin-set Epoxy Terrazzo Flooring System falls under the following classification:

| Material          | Mass % |
|-------------------|--------|
| Calcium carbonate | 70-80% |
| Epoxy resin       | 10-15% |
| Glycidyl Ether    | 2-3%   |
| Methyl Ester      | 1-2%   |
| Amine             | 0-1%   |
| Phenois           | 0-1%   |
| Other additives   | 0-1%   |

"Mortar, Monolithic Mortars, and Terrazzo: A composite material consisting of marble, silica sand, granite, glass or other suitable aggregate in a binder matrix of Portland cement mortar, epoxy resin, polyester resin, or vinyl ester resins."

The terrazzo flooring system configuration consists of four resinous layers and aggregates. Among the four layers, the primer layer and the matrix layer are necessary while the moisture vapor treatment layer and the iso-crack membrane layer are optional but recommended. The moisture vapor treatment layer is necessary if the concrete slab does not meet the humidity requirement.

## **System Boundary**

This EPD is a cradle-to-grave study.

## **Additional Environmental Information**

Terroxy Terrazzo Flooring System is GreenGuard Gold Certified.

### Data Quality Assessment and Disclosure and Explanation of Any Data Gaps

### **Geographical Coverage**

The geographical scope of the manufacturing portion of the life cycle is Alsip, IL. All primary data were collected from the manufacturer. The geographic coverage of primary data is considered excellent.

The geographical scope of the raw material acquisition is USA. Customer distribution, site installation and use portions of the life cycle is North America. Default shipping distance values from the PCR were used in the study. In general, the data is considered good.

Disposal and end-of-life geographic coverage (i.e. site of disposal location) was assumed to be 20 miles from the construction site to a landfill. This data is considered acceptable.

In selecting secondary data (i.e. GaBi Datasets), priority was given to the accuracy and representativeness of the data. Geographic coverage was considered in assessing representativeness. When available and deemed of significant quality, country-specific data was used. However, priority was given to technological relevance and accuracy in selecting secondary data. This often led to the substitution of regional and/or global data for country-specific data. Overall geographic data quality is considered good.

#### **Time Coverage**

Primary data were provided by the manufacturer and represent all information for calendar year 2018. Using this data meets the PCR requirements. Time coverage of this data is considered very good.

Data necessary to model cradle-to-gate unit processes was sourced from thinkstep LCI datasets. Time coverage of the GaBi datasets varies from approximately 2010 to present. All datasets rely on at least one 1-year average data. Overall time coverage of the datasets is considered good and meets the requirement of the PCR that the data be updated within a 5-year period with the exception of four datasets due to the unavailability of newer ones.

#### **Technological Coverage**

Primary data provided by the manufacturer is specific to the technology that the company uses in manufacturing their product. It is site-specific and considered of good quality. It is worth noting that the energy and water used in manufacturing the product includes overhead energy such as lighting, heating and sanitary use of water. Sub-metering was not available to extract process only energy and water use from the total energy use. Sub-metering would improve the technological coverage of data quality.

Data necessary to model cradle-to-gate unit processes was sourced from GaBi LCI datasets. Technological coverage of the datasets is considered good relative to the actual supply chain of the manufacturer. While improved life cycle data from suppliers would improve technological coverage, the use of lower quality generic datasets does meet the goal of this LCA.

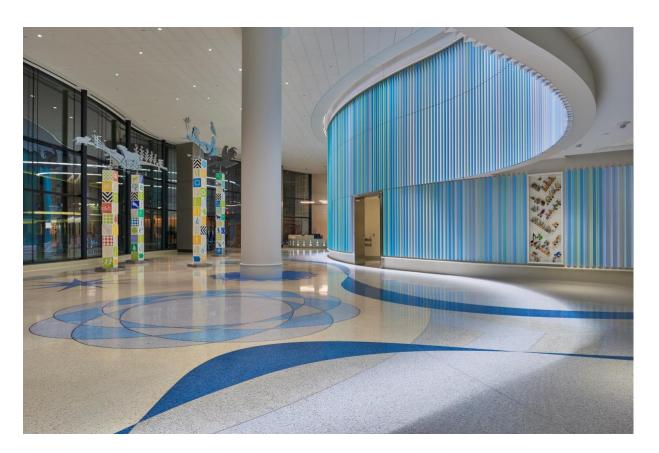

### **Secondary Data**

Whenever possible, primary data was used for all processes. When primary data did not exist, secondary data for raw material production, generic data was used from the GaBi database.

### **Cut-off Criteria**

Material inputs greater than 1% (based on total mass of the final product) were included within the scope of analysis. Material inputs less than 1% were included if sufficient data was available to warrant inclusion and/or the material input was thought to have significant environmental impact. Cumulative excluded material inputs and environmental impacts are less than 5% based on total weight of the functional unit. In addition, as per PCR, substances that are characterized as hazardous according to Globally Harmonized System are not cut off. Therefore, there are no known substances, energy resources or environmental impacts excluded.

### **Life Cycle Assessment Results**

The results below represent the impacts of the product system under three reference service life scenarios—20 years, 30 years and 60 years. All results are given per functional unit, which is 1 m2 of covered and protected flooring surface over 60 years.

Table 8: Impact Category Key

| Table 8: Impact Category Key |   |           |   |  |  |  |  |  |  |  |

| PERE                         | Use of renewable primary energy excluding renewable primary energy resources used as raw materials                  | PENRT     | Total use of non-renewable primary energy resources (primary energy and primary energy resources used as raw materials) |  |  |  |  |  |  |  |
| PERM                         | Use of renewable primary energy resources used as raw materials   | SM        | Use of secondary materials  |  |  |  |  |  |  |  |
| PERT                         | Total use of renewable primary energy resources (primary energy and primary energy resources used as raw materials) | RSF       | Use of renewable secondary fuels  |  |  |  |  |  |  |  |
| PENRE                        | Use of non-renewable primary energy excluding non-<br>renewable primary energy resources used as raw<br>materials   | NRSF      | Use of non-renewable secondary fuels  |  |  |  |  |  |  |  |
| PENRM                        | Use of non-renewable primary energy resources used as raw materials   | FW        | Net use of fresh water  |  |  |  |  |  |  |  |
| HWD                          | Disposed-of hazardous waste   | CRU       | Components for reuse  |  |  |  |  |  |  |  |
| NHWD                         | Disposed-of non-hazardous waste   | MFR       | Materials for recycling   |  |  |  |  |  |  |  |
| HLRW                         | Disposed-of high-level radioactive waste  | MER       | Materials for energy recovery   |  |  |  |  |  |  |  |
| ILLRW                        | Disposed-of intermediate and low-level radioactive waste  | EE        | Exported energy   |  |  |  |  |  |  |  |

Significant data limitations currently exist within the LCI data used to generate waste metrics for Life Cycle Assessments and Environmental Product Declarations. The waste metrics were calculated in a way conformant with the requirements of ISO 21930:2017, but these values represent rough estimates and are for informational purposes only. As such, no decisions regarding actual cradle-grave waste performance between products should be derived from these reported values.

### Interpretation

Overall, the raw material extraction (A1) is the largest impact contributor in one single 60-year reference service life of the product system in study. Despite the high mass percentage of aggregates in the whole flooring system, the major impacts come from the resins and other fossil-based compounds. This is not unexpected considering the substantial resources needed to produce raw materials of this type and that resins and other fossil-based compounds together represent over 60% of the non-aggregate ingredients. On the other hand, the impacts from the manufacturing stage (A3) across all the indicators is negligible. This points out that formulation optimization is a focal area where the manufacturer may be able to effectively reduce its product environmental impact.

Besides raw material extraction, the two transportation stages (A2 and A4) are also worth attention. The high mass of aggregates in the product system leads to a heavier footprint in transportation than those light weighted products. Improving the supplier diversity of aggregates may be helpful to reduce the transportation distance of aggregates. Finally, from a broader standpoint, improving the product system's performance and durability can be an effective measure. In the assessment, the reference flows across three reference service life scenarios ranges from 42 kg to 123 kg. A longer reference service life of the product system leads to better environmental performance across all impact categories over the whole life span of a building.
