Assessment goal and scope

The potential environmental impacts of LexCo Collection Desk and its packaging throughout its entire life cycle – including raw materials extraction, production, transport, use, and end of life – were assessed. In the absence of primary information, the GaBi database was used for secondary data.

The life cycle stages included in this assessment follow the BIFMA PCR for Tables: UNCPC 3812. Material acquisition and preprocessing (including transportation), production, distribution, use and end-of-life are assessed for the table product.

Assessment boundary

The Life Cycle Assessment considers the full life cycle of the product as described here, cradle to grave. Life cycle stages and phase included in this assessment follow the BIFMA PCR for Tables and are presented in the following table.

Product recycled content* and recyclability** summary

RECYCLABILITY BY WEIGHT**

^{*}Product and packaging composition is for the LexCo Collection Desk manufactured in Dongguan, China. The same configuration is manufactured at both the India and China facilities. The life cycle impact results are the weighted average based on production share.

^{*}Total recycled content based on supplier's data. The source of recycled content of various materials could be either post-industrial or post-consumer based on market availability.

^{**}Recyclability: this recyclability rate is the maximum amount of the product that is recyclable, based on the availability of recycling facilities in the specified regions and the ability of the product to be disassembled. Note that, per the requirements of the PCR, the end-of-life results presented in this EPD were calculated using the US EPA's recycling rates within the 2020 Municipal Solid Waste Report for parts that can be disassembled.

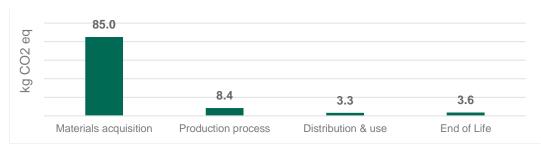

Life cycle impact by category and stage

Environmental impacts were calculated using the GaBi software platform. Impact results according to the BIFMA PCR have been calculated using IPCC GWP AR6 (100y) and TRACI 2.1 characterization factors, as well as LCI indicators for primary energy and water usage. Results presented in this report are for one m² (0.17 units) of a LexCo Collection desk, maintained for 10 years. Additionally, the results are relative expressions and do not predict impacts on category endpoints, the exceeding of thresholds, safety margins, or risks.
